SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: Arthur Marschel Examiner #: 67345 Date: 6-12-01
Art Unit: 1631 Phone Number 308-3894 Serial Number: 08/973,381
Mail Box and Bldg/Room Location: CM1/12A11 Results Format Preferred (circle): PAPER/DISK/E-MAIL
(12D04)

If more than one search is submitted, please prioritize searches in order of need.

****

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

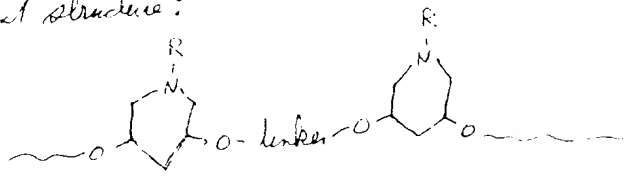
Title of Invention: Aminodiol oligomers

Inventors (please provide full names): Normand Hebert

Earliest Priority Filing Date: 6/7/96

For Sequence Searches Only *Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

Please search for polymers containing the following chemical structure:



R = any substituent or H; preferably either a nucleobase or amino acid side chain

linker = any chemical linkage, preferably a phosphate or phosphodiester linkage

Reaction of 2-OHCC6H4OCH2CH2OC6H4CHO-2 with 1-1,4-diamino-2,3-butanediol and 1-2,3-diamino-1,4-butanediol gave macrocycles I and II, resp., in [illegible] yield. I existed in DMSO without its Schiff base ring-opened tautomers, even on heating, although heating in DMSO-d6 produced these tautomers. The analogous tautomers of II could not be produced. The effects of chelation on ring-chain tautomerism of II showed that Ni II , Cu II , and Pb II are complexed by different tautomeric forms, depending on the size of the cation. Condensation of 1,10-phenanthroline-2,9-dicarboxaldehyde with the above **diaminodiols** gave 1:1 macrocycles, which formed partly unbiased, isoenergetic dynamic **combinatorial libraries** over a wide temp. range.

AB The linear, enantiomerically pure C-8 amino aldehyde I (n = 1) is prepd. by addn. of di-Et azodicarboxylate (DEAD) to 1,3-cyclooctadiene, ...olysis, redn., and enzymic asymmetrization, by enzymic esterification of the meso diol II (R1 = R2 = H) to give monoacetate II (R1 = H, R2 = Ac). Enzymic hydrolysis of diacetate II (R1 = R2 = Ac) gave the enantiomeric monoacetate II (R1 = Ac, R2 = H). Lipozyme IM proved to be the enzyme of choice for both alternatives (...-80% yield each, ee ...). Stereoselective pinacol coupling of I (n = 1) and homolog I (n = ...) by Pedersen's reagent [V2Cl3(THF)6]2[Zn2Cl6] gave adducts in ...-...% yields, with III (R = CO2Et) being the predominant isomers. In the case of I (n = ...), ... equiv of reagent (ca. 1 equiv of V2+) was sufficient to bring about total conversion; for total conversion of I (n = ...), a significant excess of reagent was needed (... equiv, ca. 4 equiv of V2+). From III (R = CO2Et) examples for potential **libraries** of structurally varied derivs., such as cyclic ureas and pseudotetrapeptides III (R = ...-Val) are prepd.

AB This paper describes a general approach to rapid generation and screening of catalytic materials on electrode surfaces. The properties of the resulting conducting polymers, including catalytic performance, can be modulated by varying the monomer feed ratios, monomer choice, and applied potential. Thus, the generation of the polymeric TEMPO (2,2,6,6-tetramethylpiperidin-1-yloxy) catalysts was performed by electrochem. copolymn. of 2,2'-bithiophene with the TEMPO catalyst precursors contg. pyrrole side chains. A **library** of catalyst films was obtained over a wide range of bithiophene pyrrole ratios upon automated scanning of the applied potential from +0.0 to +1.4 V vs. Ag/AgCl. The resulting catalyst films were used in both chem. and electrochem. oxidn. of primary alcs. to aldehydes.

AB A **combinatorial library** motif has been developed based
on orthogonally protected aminodiol scaffolds. Amine functionality was
derivatized by diverse available electrophiles including carboxylic acids,
sulfonyl chlorides, isocyanates, and aldehydes. A hydroxyl moiety was
converted to a carbamate linkage, allowing a variety of amines to be
incorporated. The scaffold was anchored to Tentagel at the second
hydroxyl via a succinyl linker, which was hydrolyzed by mild aq. basic
conditions. The method was used to make a **library** of about
17,000 different members in mixts. of 5 per sample.

AB A combined rational and library approach was used to identify bisphosphonates (IC50 = [illegible] mM) and galactose type 1-N-iminosugar (IC50 [illegible] mM) as novel motifs for selective inhibition of .beta.-1,4-galactosyltransferase (.beta.-1,4-GalT) and .alpha.-1,3-galactosyltransferase (.alpha.-1,3-GalT), resp. Our results demonstrate that, though these two galactosyltransferases both utilize the same donor sugar-nucleotide (UDP-Gal), the difference in their mechanisms can be utilized to design donor sugar or nucleotide analogs with inhibitory activities selective for only one of the galactosyltransferases. Investigation of .beta.-1,4-GalT inhibition using UDP-2-deoxy-2-fluorogalactose (UDP-2-F-Gal), UDP, and bisphosphonates, also led to the observation of metal dependent inhibition of .beta.-1,4-GalT. These observations and the novel inhibitor motifs identified in this study pave the way for the design and identification of even more potent and selective galactosyltransferase inhibitors.

AB The present invention provides a **combinatorial** approach for prepg. arrays of chem. sensitive polymer-based sensors which are capable of detecting the presence of a chem. analyte in a fluid in contact therewith. The described methods and devices comprise combining varying ratios of at least 1st and 2nd org. materials which, when combined, form a polymer or polymer blend that is capable of absorbing a chem. analyte, thereby providing a detectable response. The detectable response of the sensors prepd. by this method is not linearly related to the mole fraction of at least one of the polymer-based components of the sensors, thereby making arrays of these sensors useful for a variety of sensing tasks.

AB Azasugars have the distinction as a class of natural products in that most of them have been synthesized before they were isolated. Syntheses of .alpha.- and .beta.-homomannonjirimycin rely on the stereoselective and chemoselective sodium cyanoborohydride redn. of a [3.3.0] bicyclic imine lactone to give a single [3.3.1] bicyclic amino-lactone. Methanolysis under basic conditions is accompanied by efficient epimerization of the first formed .alpha.-amino-ester to the more stable .beta.-amino-ester in which the 2,6-substituents are equatorial. Both the [3.3.1] bicyclic amino-lactone and the .beta.-amino-ester are suitable intermediates for the incorporation of tetrahydroxypipecolic acid derivs. into **combinatorial libraries** directly. .alpha.- and .beta.-Trihydroxyl analogs of aza-D-mannopyranose, resp. Methylamides are shown to be specific and potent inhibitors of two .beta.-N-acetylglucosaminidases but have no effect on an .alpha.-N-acetylgalactosaminidase. The synthesis of .alpha.- and .beta.-manno-pipecolic acids is also reported.

AB It expand the availability and soly. range of polymer supports for solid-phase org. synthesis (SPOS). We have applied a sequential normal and "living" free radical polym. to generate a **library** of 24 copolymers possessing either block or graft architecture with initiator and a diverse set of vinyl monomers. The structure, mol. wt., and polydispersity (PD) of the individual **library** members have been detd. by size exclusion chromatog. (SEC), 1H and 13C NMR, and as a function of the soly. of each polymer in a range of solvents. One copolymer, polyBS-LS (Mn = 17 000, PD = 1.84) derived from 4-tert-butylstyrene (BS), 3,4-dimethoxystyrene (LS) has a soly. profile sol. in toluene, THF (THF), ether, acetone and methylene chloride (DCM), insol. in methanol and water, that is different from the present polymer support (PS) for LPOS, polyethylene glycol (PEG), and was studied in stoich. details as a new support in LPOS. The .alpha.-nitrile groups of polyBS-LS are reduced smoothly with LiAlH4 in THF to give the amino functionalized copolymer (0.14 mmol g-1 of amino groups based on a quant. ninhydrin anal.). Kinetic studies have revealed that derivatization of the amino groups of the copolymer with 4-dimethylaminocinnamaldehyde occurs at a comparable rate to a soln. counterpart (kpolyLS = 3.49 L mol-1 h-1 vs 4-aminohexane = 6.69 L mol-1 h-1). Following reaction with N-glutaryl-(2S,4S)-4-diphenylphosphino-2-[(diphenylphosphino)methyl]pyrrolidine and exchange of Rh(I), the resulting phosphine cont. copolymer, catalyzes the enantioselective hydrogenation of (Z)-N-acetamidoacrylic acid to N-acetylalanine in THF. An 87% enantiomeric excess (ee) of (S)-N-acetylalanine is obtained, comparable to that obsd. with a homogeneous phosphine ligand. This work highlights the power of a parallel polymer synthesis strategy, from conception to application, for the generation of polymers possessing unique soly. profiles and functionality which can serve as novel supports in LPOS.

AB A mem. synthesis app. is described for building chem. compds. including a nozzle assembly having an array of movable nozzles coupled to reservoirs of reag. reagents and a base assembly having an array of reaction wells. A transport mechanism aligns selected nozzle columns in the X-direction, and independently controllable sliders move nozzle columns in the Y-direction. The first sliding seal and the plurality of second sliding seals form enclosed reaction wells while permitting reagent delivery. A gas inlet and outlet sweep away fumes emitted by reagents. Methods of compd. synthesis from chem. components are also provided. The app. permits the synthesis of chem. **libraries**.

ANSWER [illegible] ACCESSION [illegible]
TI [illegible]
AU [illegible]
CS [illegible]
SO [illegible]
AB [illegible] **Combinatorial** chem. has become an important method [illegible] identifying effective ligand-receptor binding, new catalysts and enzyme inhibitors. In order to distinguish the most active component of a **library** [illegible] obtain structure-activity relationships of cmpds. in a **library**, an efficient quant. assay is crucial. Electrospray mass spectrometry has become an indispensable tool for qual. screening **combinatorial libraries** and its use for quant. assay has recently been demonstrated. Results: This paper describes the use of quant. electrospray mass spectrometry for screening **libraries** of inhibitors of enzymic reactions, specifically the enzymic glycosylation by .beta.-1,4-galactosyltransferase, which catalyzes the transfer of galactose from uridine-5'-diphosphogalactose to the 4-position of N-acetylglucosamine .beta.OBn. Butbenzene [illegible], from N-acetyllactosamine .beta.OBn. Our mass spectrometric screening approach showed that both nucleoside diphosphates and triphosphates inhibited galactosyltransferase while none of the nucleoside monophosphates, including uridine-5'-monophosphate, showed any inhibition. Addnl. **libraries** were generated in which the concns. of the inhibitors were varied and, using mass spectrometry, uridine-5'-diphosphate-2-deoxy-2-fluorogalactose was identified as the best inhibitor.

AB A **high-throughput** assay for UDP-Glc:1,3-.beta.-D-glucan synthase (EC 2.4.1.34, UDP-glucose:1,3-.beta.-D-glucan, 1,3-.beta.-D-glucosyltransferase) from fungi and higher plants is described. The assay is performed in microtiter plates and is extremely sensitive compared to other std. assays for these enzymes. The assay is principally achieved by replacing the conventional substrate UDP-[14]Glc with the nonradioactive counterpart, and the nonradioactive glucan product is quantified as a fluorescent complex following specific interaction with the fluorochrome present in com. aniline blue. In addn., the assay is [illegible] In fact, the assay is highly reproducible and nearly as sensitive as radioactive assays and has the addnl. advantages of increased safety and avoidance of the need for filtration and washing steps to collect the glucan product. As such, the assay is highly suitable for **high-throughput** screening for inhibitors of these enzymes.

AB L-Deoxyrhamnojirimycin (I) does not inhibit naringinase significantly but 1-epi-L-deoxyrhamnojirimycin (II) is a potent inhibitor. Conversely, alpha.-L-glycosides, e.g. III (R = H, CH2OH), of I are good inhibitors of L-rhamnosidase whereas those of II are not. Intermediate azabicyclic lactones are likely to be of use for the incorporation of a no. of trihydroxypipecolic acids into peptide **libraries**.

DT [illegible] Abstract

LA English

AB **library** [illegible] [illegible] compds. based on **aminodiol** [illegible] has been prepd. The scaffold was attached to Wang resin [illegible] Fmoc-protected aminoalkyl bromide linker, then derivatized with different electrophiles at the nitrogen to yield ureas, sulfonamides, amides, and tertiary amines. The second hydroxyl is converted to an alkyl. bromide with carbonyl diimidazole, then further converted to a carbamate with a variety of amines. The mild linking chem. is amenable to use with com. available protected and unprotected reagents, thus allowing a variety of reactive groups to be introduced while avoiding laborious prepn. of further reagents. The compds. were synthesized at a rate of 48 compds. per day as mixts. of five compds. per well using a Bristol parallel array or well synthesizer. Complete synthetic details and preliminary [illegible] data for this set of compds. will be presented.

TI Preparation of benzimidazole derivatives and **combinatorial libraries**

IN [illegible]

PATENT NO. KIND DATE APPLICATION NO. DATE
[illegible]

AB The invention relates to novel benzimidazole derivs. I [R1-R4 = H, halo, protected OH, cyano, un substituted alkyl, alkynyl, alkoxy, aryl, heterocyclyl, carbamoyl, etc.; R5 = H, un substituted alkyl, Ph, phenylalkyl, CO2H, amino, heterocyclyl, etc.; R6 = -D-W-E-, wherein W = bond, un substituted phenylene, cycloalkylene, arylene, heterocyclene, etc.; D = un substituted cycloalkylene, phenylene, NH, etc.; E = bond, groups given for D; R7, R8 = H, resin, un substituted alkyl, Ph, heterocyclyl, cycloalkenyl, sulfonyl or carbonyl derivs.; with provisos requiring that one of R1-R4 = un substituted NHNH when R6 = NH]. The invention further relates to **combinatorial libraries** contg. two or more such compds., as well as methods of prepg. them. The compds. are potentially useful due to their activity. For instance, a **library** of 96,256 such benzimidazole derivs. was prepd. in arrays of 96 arom. or heteroarom. alkenylenes or amino acids, 96 diamines, and 96 amines. The synthetic method involved coupling of an N-protected amino acid component to an amine resin, deprotection of the amino acid component resin, acylation of the amine with 4-fluoro-3-nitrobenzoic acid, displacement of the fluoro group with an amine component, reduction of the nitro group to an amine, condensation of the aldehyde with an aldehyde component, and cleavage from the support with HF. AB The title compds. (I) [wherein R1 = H, OH, alkyl, alkoxy, halo, CF3, or CN; R3-R5 = independently H, OH, halo, CF3, alkyl, alkoxy, NO2, CN, or [illegible] or NH(m-(CH2)n-R9, where R9 = H, OH, CO2H, or NR10R11; m = 0 or 1; n = [illegible]-4; R10 and R11 = H, alkyl, or taken together with the N to which they are attached form a 3-10 membered ring; Z = CO2R7, tetrazolyl, CONR6R7, CONHNR10R11, or CH2OR7; R6 and R7 = independently H, (cyclo)alkyl, alkenyl, alkynyl, acyl, (hetero)aryl, or taken together with the N to which they are attached form a 3-10 membered ring, etc.] were prepd. by std. or **combinatorial** synthetic methods involving the addn. of halobenzoic acids to haloanilines and optional redn. or amidation of the acid. Thus, treatment of 2-amino-5-iodotoluene in THF with LDA in THF/heptane/ethenylbenzene soln., followed by addn. of 2,4-difluorobenzoic acid in THF afforded II. Combination chemotherapy of I with a known mitotic agent caused dramatic increases of apoptosis of colon and lung carcinoma cells. For instance, 2-(2-chloro-4-iodophenylamino)-N-cyclopropylmethoxy-3,4-difluorobenzamide (PD 184352) in combination with paclitaxel resulted in 44 to 55% apoptosis, [illegible] increases over using either agent alone, of colon 26 carcinoma, HT-29 colon carcinoma, and A549 lung carcinoma cells.

AB In the solid phase prepn. of an amine a **diol** is monoalkylated with a chloromethyl resin followed by reaction with N,N'-carbonyldiimidazole to afford a resin-bound tertiary-alkoxycarbonylimidazole which is N-alkylated and then sequentially treated with appropriate building blocks and reagents to afford a resin-bound amine which affords the desired amine after treatment with an acid. Thus, HO(CH2)2CH(OMe)2OH was linked to **Merrifield** resin and treated with carbonyldiimidazole to give the resin-bound alkoxycarbonylimidazole which was treated with L-leucine Me ester hydrochloride to give resin-bound HO(CH2)2CH(OMe)2OCO-L-Leu-OMe. The methylester was converted to the hydrazide, treated with PhCH2NCS and cleaved from the resin with TFA to give the triazole I.

AB A three-component **library** of compds. was prepd. in parallel using multiple simultaneous soln.-phase synthetic methodol. The compds. were biased toward opioid receptor antagonist activity by incorporating (+)-(3R,4R)-dimethyl-4-(3-hydroxyphenyl) **piperidine** (a potent, nonselective opioid pure antagonist) as one of the monomers. The other two monomers were N-substituted or unsubstituted Boc-protected amino acids and a range of substituted aryl carboxylic acids and were selected to add chem. diversity. Screening of these compds. in competitive binding expts. with the .kappa. opioid receptor selective ligand [3H]U69,593 led to the discovery of a novel .kappa. opioid receptor selective ligand, RTI-5989-23 (I). Addnl. structure-activity relationship studies suggested that I possesses lipophilic and hydrogen-bonding sites that are important to its opioid receptor potency and selectivity. These sites appear to exist predominantly within the .kappa. receptor since the selectivity arises from a 100-fold loss of affinity of I for the .mu. receptor and an 18-fold increase in affinity for the .kappa. receptor relative to the .mu.-selective ligand, (+)-N-[(trans-4-phenyl-2-butenyl)]-(3R,4R)-dimethyl-4-(3-hydroxyphenyl) **piperidine**. The degree of selectivity obsd. in the radioligand binding expts. was not obsd. in the functional assay. A correlation of its ability to inhibit agonist stimulated binding of [35S]GTP.gamma.S at all three opioid receptors, I behaves as a highly .kappa. opioid receptor pure antagonist with negligible affinity for the .delta. receptor.

AB A homo- or hetero-oligomer is claimed having two monomeric units represented by A1(B1)nB2, A is same or different in each monomeric unit, independently selected from O, S, lower alkyl, an N-substituted alkylamino, an N-substituted arylamino and aminoalkyl; B1 and B2 = same or different, independently selected from H, lower alkyl, a labeling group, a protecting group, a phosphoramidate or a phospho-monoester; B1 can be the same or different in each monomeric unit, and in at least one of the non-nucleotide monomeric units, B1 is independently selected from a (i) condensation product of a non-vicinal **diol** attached to an H-bond donor functionality; (ii) an H-bond acceptor selected from an ether, a purine or pyrimidine substituted 1,2-**diol** or a N-substituted heterocycle; (iii) a non-vicinal **diol** attached to a hydrophobic functionality or a vicinal **diol** attached to an aryl or alicyclic hydrophobic functionality; (iv) a **diol** attached to a ring substituted anionic functionality and (v) a cationic moiety attached to a non-vicinal or alicyclic **diol**, any of which may further include a detectable label; n = 1-3. Preferred B1 moieties include condensation products of heterocyclic **diols**, alicyclic **diols**, and polycyclic **diols**. The non-nucleotide monomers thereof, **combinatorial library** mixts. of the oligomers and the use of the oligomers as selective target-binding compds. are claimed. In an example, when a **library** of non-nucleotide phosphorus ester oligomers is screened against thrombin, a subpopulation (0.001-0.01%) of the original **library** binds to the target, with an apparent Kd = 100-500 nM.

A combinatorial library I or II (S = solid support; L = spacer/linker residue; Ll = linker residue; q = 0-10; Ll = Aa1-Aa2- CHArCH(OH)CH2NR; Aa1, Aa2 = each amino acids joined by amide linkus; Aa1 cannot contain a linear chain of 3, 4, or 5 atoms which sep. the carboxyl carbonyl from the amino group of Aa1; Aa2 cannot be an alpha.-amino acid; Ar1 = aryl, heteroaryl; CH2Ar1 is attached to the N of Aa2; R1 = H, C1-20 alkyl, alkenyl, alkynyl, aryl, heteroaryl, substituted aryl or heteroaryl, aryl or heteroaryl fused to a 5- or 6-membered moiety to form a nonarom. second ring, substituted C1-20 alkyl, alkenyl, or alkynyl; X = O, N-lower alkyl, S, SO, SO2; the residue Aa1 is attached to Ll via its carboxyl and to Aa2 by its amino group) is disclosed. Thus, thientipliers III (n = 3-12, Ar = C6H5; n = 4-6, Ar = C6H3O3-2,4,6) were prepd. by Mitsunobu reaction of Me vanillate and the corresponding aryloxy-substituted alk. HO(CH2)nOAr, followed by sapon., acid chlorination, and diazoketone formation with either CH2N2 or Me3SiCHN2. Seven N-9-fluorenylmethoxycarbonyl (Fmoc)-substituted amino acids were sep. esterified to TentaGel.PTM.S PHB resin with diisopropylcarbodiimide, followed by encoding with 0.5 to 15% by mass of a linker-diazoketone reagent III in the presence of rhodium trifluoroacetate. Each of the seven resin batches was encoded by one or more linker-diazoketones III to produce an appropriate binary code. After encoding, the seven resin batches were combined and mixed to homogeneity, filtered, dried, and divided into 15 equal batches. Each batch was sep. deblocked with **piperidine**, coupled with another Fmoc-amino acid deriv., and encoded as above. The batches were again combined, re-divided into 31 batches, encoded as above, deprotected, and subjected to reductive alkylation with arom. aldehydes. The resin batches were then combined and re-divided into 31 equal batches and subjected to ring opening reactions with 31 epoxides to give the requisite resin-bound hydroxypropylamine dipeptide derivs. The individual beads can be decoded by oxidative cleavage with cerric ammonium nitrate and GC anal. using electron capture detection.

AB The multipin method of multiple solid phase synthesis was used in conjunction with **high throughput** characterization methods (ion spray mass spectrometry and HPLC) to optimize reactions rapidly for solid phase synthesis. The approach is demonstrated in the synthesis of 4-aminoproline analogs by reductive amination under a wide range of conditions, using a diverse set of amines.

AB Heterocyclic compds. I [X = O, S, CH2; X1 = O, S] bound to polymers via the X group were prepd. as reagents for the synthesis of peptides and amides. Thus, chloromethylated **Merrifield** resin [resin-C6H4CH2Cl] was treated with PhCH2SH to give resin-C6H4CH2SCH2Ph, which was oxidized by HClO to give resin-C6H4CH2SO2CH2Ph, which was cyclized with CH2(CO2Et)2 in EtOH contg. Na to give thiophene II [R = resin, R1 = H], which was esterified with COCl2 to give cyclic carbonate III [R = resin] [IV]. IV was treated with Z-Val-OH [Z = PhCH2OCO] to give active ester II [R = resin, R1 = Z-Val], which was coupled with H-Val-OMe to give Z-Val-Val-OMe. II [R = R1 = H] was esterified with COCl2 to give III [R = H], which was treated with N-protected amino acids, e.g. MeO2CCH2CO-Pro-OH, to give the corresponding active esters, e.g. II [R = H, R1 = MeO2CCH2CO-Pro]. The latter active esters were used in a series of peptide couplings in soln.
